The screenshot displays the SQLPro Studio application window. On the left, a sidebar shows a hierarchical view of a database schema for 'LOCALHOST (KYLEHANKINSON)'. The 'booktown' database is expanded, showing tables like 'actor', 'address', 'category', 'city', 'country', and 'customer'. The 'customer' table is selected, showing its columns: 'customer_id', 'store_id', 'first_name', 'last_name', 'email', 'address_id', 'activebool', 'create_date', 'last_update', and 'active'. The main editor area shows a SQL query: 'SELECT * FROM actor; SELECT * FROM address WHERE address_id = 1; SELECT * FROM city'. Below the query, the results of the first query are displayed in a table with columns: 'actor_id', 'first_name', 'last_name', and 'last_update'. The results show 7 rows of data, with the 4th row (JENNIFER DAVIS) highlighted. Below this, the results of the second query are shown in a table with columns: 'address_id', 'address', 'address2', 'district', 'city_id', 'postal_code', 'phone', and 'last_update'. The results show 1 row of data (47 MySakila Drive). At the bottom, the results of the third query are shown in a table with columns: 'city_id', 'city', 'country_id', and 'last_update'. The results show 5 rows of data. A status bar at the bottom indicates 'Finished 3 queries with 801 records. 0.242 seconds.'
